赛题 62

为 openLooKeng 开发 Python 客户端

直播导师: 王帅

项目标题:

为openLooKeng开发Python客户端

项目描述:

当前openLooKeng社区支持JDBC和ODBC驱动,期望openLooKeng也支持Python客户端,方便Python开发者基于openLooKeng引擎开发应用

项目要求:

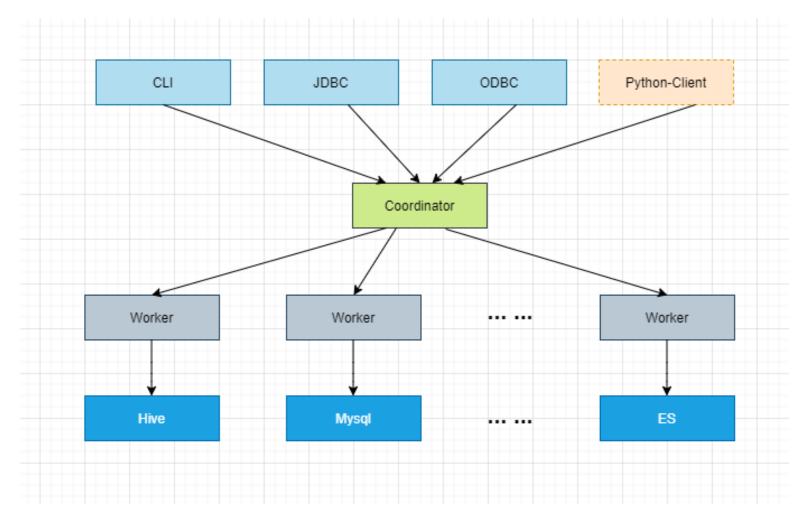

- 1、Python客户端作为openLooKeng一个模块,必须符合openLooKeng开源规范;
- 2、openLooKeng pyton客户端必须经过充分测试,包括UT覆盖率符合openLooKeng要求;
- 3、通过openLooKeng pyton客户端能正常访问openLooKeng业务。

2020 **open**Euler **高校开发者大赛**

openLooKeng是一个高性能的分布式数据虚拟化查询引擎,支持跨源跨域异构数据源的联合查询,适用于TB级或PB级的交互式查询等应用场景,能提供秒级到分钟级的查询时延响应

项目解析:

openLooKeng采用REST通信,包括CLI、JDBC与Coordinator,Coordinator与Worker。Python client 可以参考JDBC的实现逻辑,将statement按照openLooKeng要求封装成REST请求,发送给Coordinator执行。

(1) 提交查询请求 POST /v1/statement

:regheader X-Presto-User: User to execute statement on behalf of (optional)

:reqheader X-Presto-Source: Source of query

:reqheader X-Presto-Catalog: Catalog to execute query against

:reqheader X-Presto-Schema: Schema to execute query against

:query query: SQL Query to execute

(2) 查询直至查询完成 GET /v1/statement/{queryId}

:query queryld: The query identifier returned from the initial POST to /v1/statement

(1) 中的请求的response中含有nextUri属性,客户端可通过这个nextUri连接继续获取查询的进度或者最后的结果,当resoponse中不存在nextUri时,则认为此查询已完成,可通过response中data属性获取结果。

(3) 删除此查询 DELETE /v1/statement/{queryId}

:query queryld: The query identifier returned from the initial POST to /v1/statement

:reqheader X-Presto-User: User to execute statement on behalf of (optional)

:reqheader X-Presto-Source: Source of query

:regheader X-Presto-Catalog: Catalog to execute query against

:reqheader X-Presto-Schema: Schema to execute query against

2020 **open**Euler **高校开发者大赛**

项目解析:

当openLooKeng开启加密、认证时,Python client发送的REST请求必须支持加密、认证场景。

加密:

HTTPS
keystore keystore_password
truststroe truststroe_password

认证:

- Basic authentication usename password
- Kerberos authentication principal service name keytab krb5.conf
